PROJECT CASE STUDY | ENTERPRISE BILLING & CORE CUSTOMIZATION

Notification Processing & Custom Opcode Development

Custom PODL Modeling, Policy Configuration, Opcode NAP Execution & REST API Integration

DOMAIN	ENGAGEMENT TYPE	CORE FOCUS	INTEGRATION LAYER
Enterprise Billing & Core Platform Systems	**Custom Development & System Integration**	**Opcode Engineering & Notification Workflows**	**REST APIs, PODL & Policy Customization**

Project Overview

We designed, customized, and delivered a tailored backend solution centered on automated notification processing, custom opcode development, and REST API integration. Engineered to meet specific operational and technical requirements, the implementation extended core platform capabilities through custom data modeling, policy tailoring, and seamless external system communication.

Key Contributions & Technical Scope

Our engineering team executed end-to-end development, configuration, and validation across the following core areas:

- **PODL & Custom Class Development:** Created and extended Persistent Object Definition Language (PODL) schemas and custom classes tailored to specialized notification and opcode data models.
- **REST API Design & Integration:** Architected and implemented RESTful APIs to enable reliable system-to-system integration and real-time data exchange across connected applications.
- **Policy Customization:** Modified and configured core policy logic to align system rules and transactional behavior directly with business workflow requirements.
- **Opcode NAP Configuration:** Developed and configured Opcode NAP files to execute custom business logic, streamline backend operations, and support specialized platform functions.
- **Notification Module Enhancement:** Implemented and upgraded the notification processing module with rule-driven event triggers, custom formatting, and targeted delivery configurations.
- **End-to-End Testing & Troubleshooting:** Conducted thorough unit, integration, and functional testing alongside root-cause troubleshooting to ensure defect-free deployment.

Technical Components & Deliverables

Data Modeling & Schema	Custom PODL definitions and extended Storable Classes
Core Business Logic	Custom Opcodes, Opcode NAP files, and Policy Hook customizations
Integration & APIs	REST API endpoints for external service connectivity and data exchange
Event & Messaging	Requirement-specific Notification Module configuration and processing
Quality & Deployment	Integration testing, log analysis, troubleshooting, and production rollout

Project Outcome & Business Impact

- **Reliable Notification Processing:** Delivered automated, requirement-driven notification workflows with accurate event handling.
- **Seamless API Communication:** Enabled dependable, real-time data exchange across internal and external platforms via custom REST APIs.
- **Tailored Core Functionality:** Aligned platform behavior with business rules through clean PODL, policy, and opcode customizations.
- **Smooth Production Delivery:** Completed integration, testing, and troubleshooting on schedule to support stable operations.
